

PE COMPOUNDS

PLASTICKAR, AUGUST 2021

PE COMPOUNDS

PE compounds are a combination of 'PE and CaCO_3 ' and are mainly used for PE bags and films, blow mold and injection mold products based on LDPE, HDPE, LLDPE or a combination of them.

PE is the major material in the compound (70-95%), the remaining (5-30%) contains CaCO_3 and some additives. Therefore the quality of the compound is very close to PE raw material.

In some cases you can use this compounds directly as an alternative to the PE resin to produce products such plastic bags, blow molding dishes, disposable tablecloths and etc.
